ABOUT LEED®

The buildings in which we live, work, and play affect our health and the environment in numerous ways. "Green" or sustainable building is the effort to improve human health, as well as the environmental, economical, and social values of new and existing development. Green building promotes the efficient use of materials and resources and their impact on the environment through the design, construction, and operating practices of building.

In 1995 the U.S. Green Building Council developed the LEED® rating system in response to the demand for a definition of "green building." According to the USGBC, "The LEED (Leadership in Energy and Environmental Design) Green Building Rating System® is a voluntary, consensus-based national standard for developing high performance, sustainable buildings."

ARDEX and HENRY are committed to providing our customers with information and materials that promote resource conservation and environmental quality throughout the building process.
